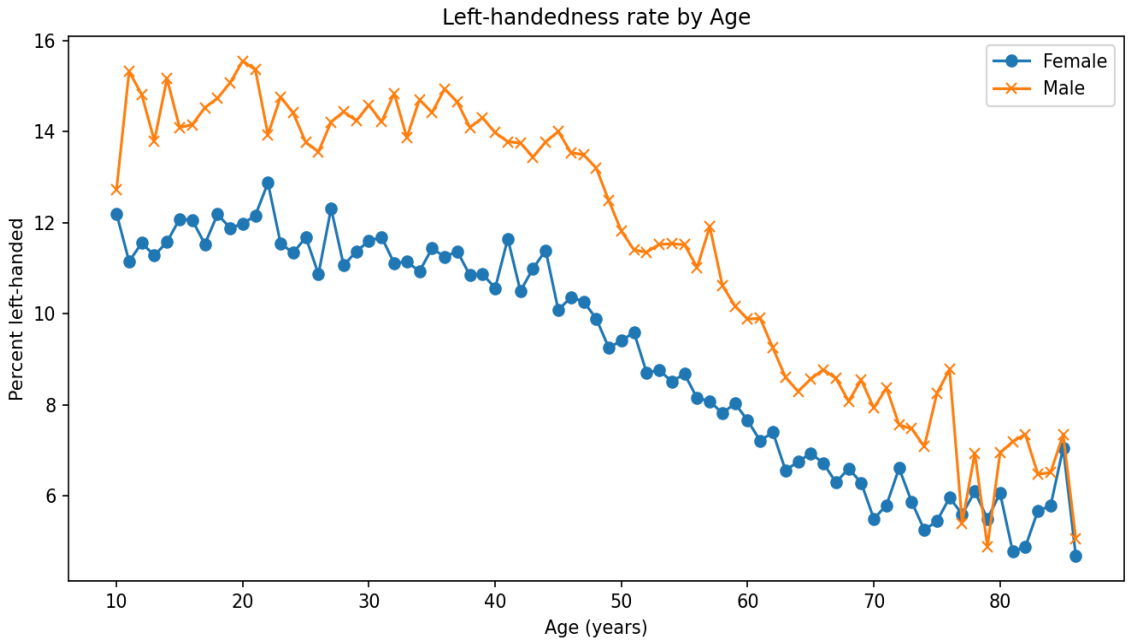
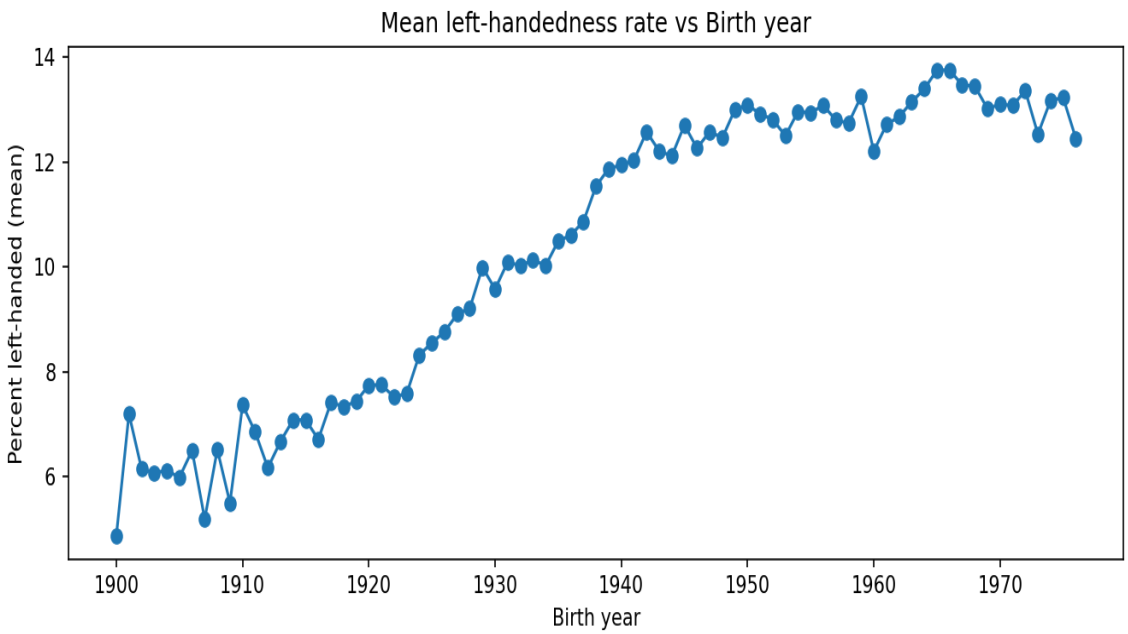
Analysis: Death Age Difference between Left- and Right-Handers

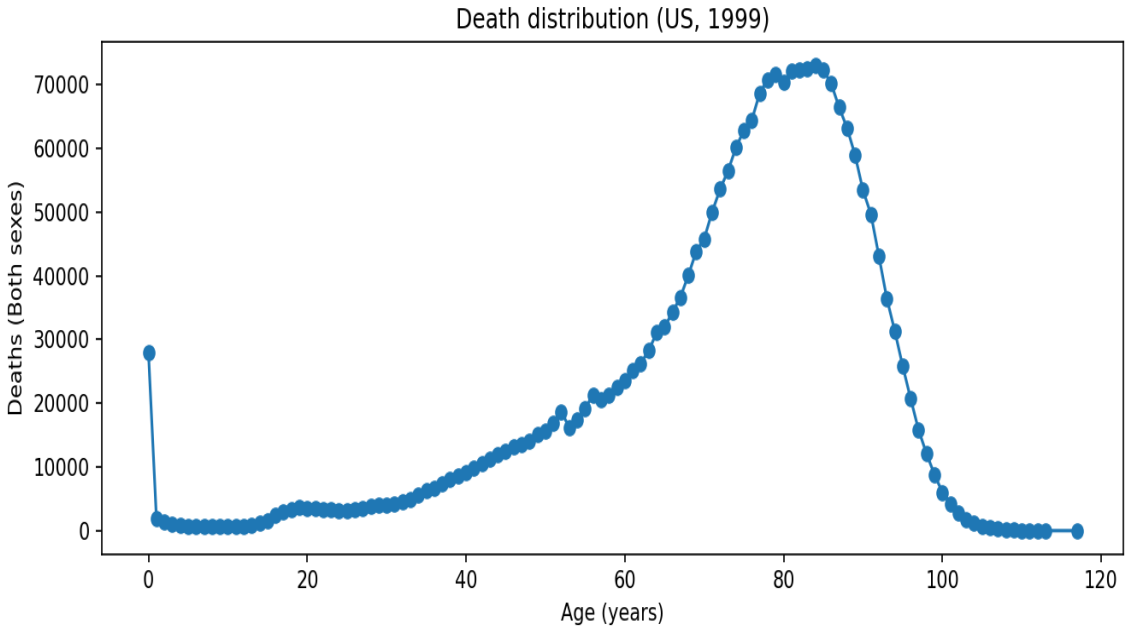
This report analyzes digitized data on left-handedness rates and U.S. death distributions to estimate whether left-handers tend to die younger than right-handers.



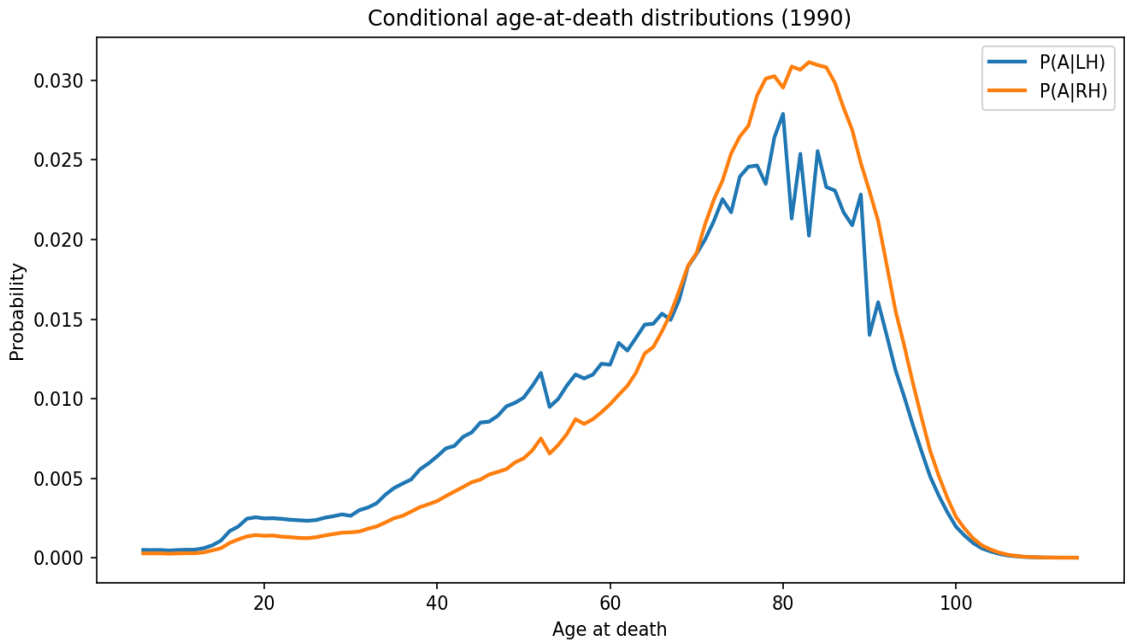
Left-handedness rate by Age



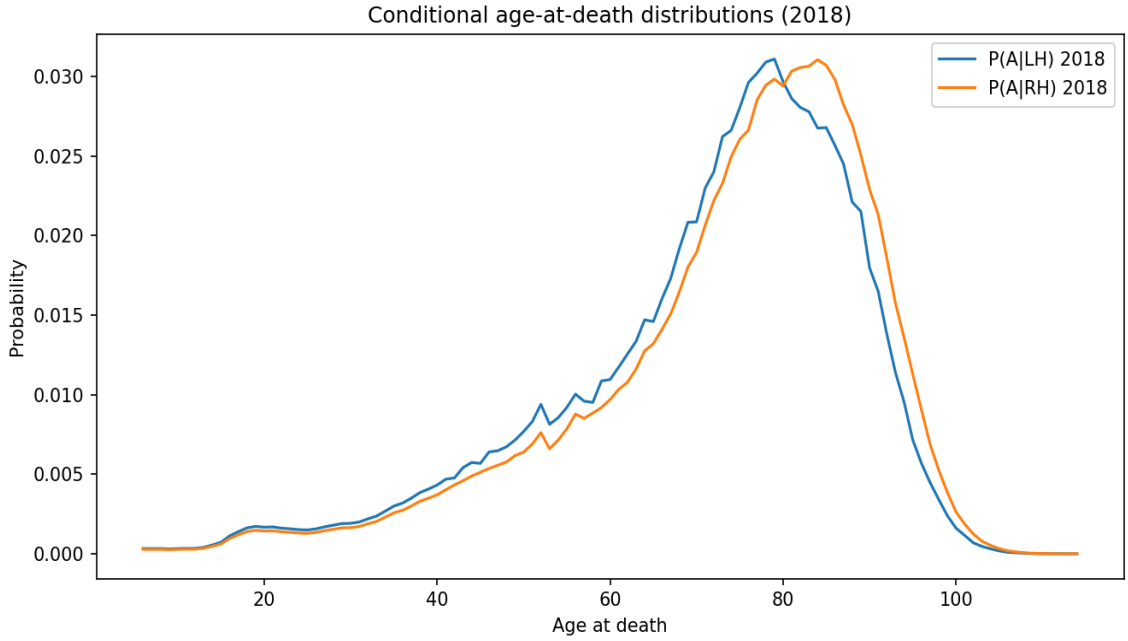
Mean LH rate vs Birth Year



Death distribution (US, 1999)



Conditional age-at-death (1990)



Conditional age-at-death (2018)

Key Results:
1990 Average LH age: 67.25 years
1990 Average RH age: 72.79 years
Difference (RH - LH): 5.55 years

2018 Average LH age: 70.29 years
2018 Average RH age: 72.63 years
Difference (RH - LH): 2.34 years

Interpretation:
In earlier generations, left-handers appear to have slightly lower average ages at death, but this difference largely disappears by 2018, likely due to reduced cultural suppression of left-handedness in younger cohorts.
